

# Yugoslav home computers of the 80's

When the whole world started making home computers, former Yugoslavia had an import law that practically forbade import of such machines.

In 1984 the first Yugoslav home computer appeared (completely open source, by today's standards) and started a revolution in home computing...

# Who am I...

- Passionate about old 8-,16- and 32-bit home computers (not x86 PC!)

- One of the founders of Once Upon a Byte nonprofit organization, [www.onceuponabyte.org](http://www.onceuponabyte.org)

# Home computers in Yugoslavia, 1980-1984

- 50DM limit on import of any foreign goods
- Relatively poor domestic integrated circuit industry, no microprocessors
- Draconian import charges
- 1982: EL-82, Z80, 16kB RAM, 6000DM

So, how could average person (salary) in Yugoslavia obtain a home computer?

# First solution...

CUSTOMS

Smuggling, of course!

[ It's a dishwasher part...  
"Spectrum Superwash"... Beleive  
me... See, it's made of rubber,  
that's because of all the water... ]

...second...

Legally importing foreign computers, and selling them for 2,3 or more times the price outside Yugoslavia

... and finally, the third one!

# So, what happened to all those computers?

ZX vs C64 vs CPC vs Atari vs ...

# The promise of a school computer

# Old Yugoslav home computers today

- Emulators for most machines exist
- Pecom Emulator (part of MESS), Miodrag Milanović (he was working many other east-european computers emulators), <http://micko-wip.blogspot.com/2008/11/pecom-64.html>
- Work is ongoing on Lola 8A emulator (ROMS were extracted only a few months ago)
- A lot of individuals (including people at Once Upon a Byte) are trying to save as many about those machines as they can
- They can be seen in several computer history museums in former Yugoslavia
